

Customer Support Escalation Policy

Document owner: Support • Last updated: 2026-01-18

Support operates 09:00 to 18:00 local time in three coverage zones, which produces effective coverage from approximately 22:00 UTC to 18:00 UTC on working days. Outside those hours only the on-call paging path reaches a human, and that path is reserved for S1 and S2 conditions. Weekend coverage is on-call only, with the exception of Enterprise agreements that specify otherwise.

First response targets

Plan	Standard first response	S1 first response	Hours
Starter	No target; community forum and documentation	No target	—
Growth	8 business hours	8 business hours	Business hours
Scale	2 business hours	30 minutes	Business hours
Enterprise	Per agreement	Per agreement	Per agreement
Enterprise — Kirren Retail	2 business hours	15 minutes	Any hour, including weekends

Table 1. First response targets by plan. Kirren Retail is listed explicitly because their terms are the most demanding currently in force.

These are first response targets rather than resolution targets, and the distinction is stated in every agreement. A first response that says we have reproduced this and are investigating satisfies the target; an automated acknowledgement does not, and the ticketing system is configured not to count one.

Declaring severity

Support may declare an S1 or an S2 directly, without engineering agreement and without checking with anyone first. This is deliberate and is stated identically in the engineering on-call document. A support engineer who believes delivery is broken for multiple tenants pages immediately, and the severity is corrected afterwards if they were wrong. There is no penalty for a false page, there is no record kept of false pages, and a support engineer who hesitates in order to avoid being wrong has made the more serious error.

Escalation path

For anything support cannot resolve within one hour: post in the engineering channel with the tenant ID, the region, the affected endpoint, and a note of what has already been ruled out. That last element is what makes the difference between an escalation that receives a fast answer and one that receives a series of questions you have already answered. Where the situation is an S1 or S2, page the primary on-call instead of posting; the channel is for things that are not urgent enough to page.

Do not send direct messages to individual engineers about customer issues. The context then becomes invisible to whoever picks the issue up next, and the engineer who received the message becomes a single point of failure for a customer problem, usually without having agreed to it. This applies even where the engineer is the obvious owner of the affected service, and it applies with particular force outside that engineer's working hours.

Common ticket categories

Rank	Category	Typical resolution
1	Signature verification failing on the customer side	Body is being re-serialised before signing; point at the quickstart
2	Confusion about retry ordering within an endpoint	Genuinely counterintuitive; explain rather than link
3	Unexpected overage charges	Check replayed events; replays are counted again
4	Endpoints timing out	Receiver is doing work before responding; point at the quickstart
5	Fewer events delivered than expected	Usually an open circuit breaker; check the endpoint status

Table 2. Most frequent ticket categories during 2025, by volume.

Service credits

Service credits are never promised by support, never estimated by support, and never discussed by support even in general terms. Any credit conversation is routed to the account owner in sales, who checks the individual agreement, because entitlement varies between agreements and no support engineer is expected to have read them. Support may confirm that an incident occurred, may state its duration, and may point the customer at the published postmortem where one exists. That is the full extent of what support may say, and it is more than most companies permit.
